LAB Interoperability Module

Bringing Orders and Results in to your EMR

LAB Interoperability Module from ViSolve is an integration platform that enables physicians and staff to place orders and review results and images right from their EMR.

It improves workflow by virtually eliminating test codes errors, routing orders to different labs, receiving results and images directly in the physician’s HER for a complete patient profile, and helping track rejections and order status.

LAB Interoperability Module not only brings down cost but saves time helping physicians spend more time on care and deliver improved patient outcome.

For Physicians

Challenge

One of the critical challenges faced by Physicians today is, blame it on Meaningful Use requirement, sending Lab Orders electronically.

Physicians who have adopted Electronic Medical Records(EMR) find that connecting their EMR(s) with disparate Lab Information Systems(LIS) for electronic transfer of orders require customized point-to-point interfaces for each system, which mounts the challenge.

The interface development/ implementation cost, effort, time and training costs not just eats in to physician’s budget but prolongs effective patient care.

Other perceptive issues include factors that determine routing of orders to different Labs such as Physician preferences, insurance and specialty to name a few. The mapping of test codes, methodologies used among different lab providers adds to the concern.

Solution

ViSolve, in an effort to address this challenge and to be apart of building a better health system, developed the Lab Interoperability Module (LIM)—a standardized interface engine, gateway and a clearing-house that enables seamless connectivity between Physicians and Labs. LIM breaks the norm of building point-to-interfaces and provides a single bi-directional interface to Connect all capable systems to exchange patient information.

LAB Interoperability Module workflow

1. Physician orders tests
Physician orders tests from his EMR, which LIM converts to HL7 standards, validates, and electronically and securely routes to labs and Imaging centers.

2. Orders routed to respective labs, results returned to physician’s EMR
Orders are routed to respective labs or imaging centers based on physician preference or insurance rules. Results returned from the lab are automatically indexed with the patient profile in the physician's EMR.

3. Physician reviews results
Standardized tests results are available in the physicians EMR against respective patient’s record for review.

4. Physician shares results with team
For improved patientcare, physician can securely forward lab results to other providers. Results can also be made available for patients through the patient portal.

LIM Key Benefits
Send Lab Orders electronically and satisfy MeaningfulUseStage2CPOE requirements
Send orders to multiple labs with a single bi-directional interface – Save significantly on integration/implementation & training cost, effort and time
Eliminate test code errors (LOINC Mapping) and add value to your EHR with Order Tracking among other functionalities
Physicians who aren’t yet on an EMR can use the LIM portal for ordering and reviewing results
Securely, efficiently and effectively exchange patient information in standardized form to all those involved in the healthcare continuum

About ViSolve
ViSolve is a leading software services, product development and consulting firm committed to serve Healthcare providers and Healthcare IT Vendors by providing customized interoperable and vendor neutral healthcare IT solutions and services.
